METHODOLOGY

The Paris Club Dataset (1956–2026): Sovereign Debt Restructuring Agreements

Abstract

This dataset provides comprehensive structured data on all 543 sovereign debt restructuring agreements negotiated through the Paris Club from 1956 through 14 April 2026, covering 102 countries and US$863 billion in treated debt. The Paris Club is an informal group of official creditor countries that coordinates debt restructurings for debtor nations facing payment difficulties. Despite the public importance of these negotiations, agreement-level data has not been systematically accessible in machine-readable format.

The dataset published here was constructed by web scraping and reverse-engineering data from the Paris Club website (clubdeparis.org) using Python 3.11 with the requests and BeautifulSoup libraries. Data extraction occurred in February 2025, with subsequent manual additions through April 2026 to capture newly published agreements and adapt to significant website restructuring between February and October 2025. Where available, each agreement record includes, among other categories: debtor country, participating creditor countries, amounts treated (total, cancelled, rescheduled), debt categories, treatment terms, cut-off dates, repayment profiles, observer organizations, total external debt figures, and links to supporting documentation.

The dataset is provided in four formats: Excel file (dataset including both long and tabular versions), CSV long format (optimized for machine analysis), CSV table format (optimized for human reading), CSV long format optimized for social network analysis, and as a CSV network format (for social network analysis of value, creditors, debtors, and observers). All monetary values have been converted from text strings to numeric format, and validated to address inconsistencies in the source data. Users should cross-reference critical figures with original Paris Club documentation, as the authors have detected many inconsistencies in the underlying website architecture, which continues to evolve.

This resource enables systematic analysis of Paris Club debt restructuring patterns, such as creditor participation trends, debtor composition, and treatment evolution across the Club's history, including the post-pandemic debt crises. The dataset addresses a significant gap in publicly accessible international finance data and takes a step towards greater transparency in sovereign debt negotiations, facilitating comparative research into the current sovereign debt restructuring architecture.

1. Dataset Overview

This dataset provides comprehensive structured data on all 543 sovereign debt restructuring agreements negotiated through the Paris Club from 1956 through 28 April 2026, covering 102 debtor countries and US$863 billion in treated debt. Each agreement record includes key variables such as debtor country, participating creditor countries, amounts treated (total, cancelled, rescheduled), treatment terms, categories of debt treated, cut-off dates, observer organizations, meeting chairs, debtor delegation heads, specific provisions, total external debt figures, and links to supporting documentation.

In terms of terminology, we take "agreement" to refer to the formal documented deal between the Paris Club and a debtor country, recorded in the "Agreed Minutes" signed by all participating creditors. "Treatment" denotes the specific terms and conditions applied within that agreement. "Restructuring" is the umbrella term encompassing any modification of debt obligations, while "rescheduling" is a specific type of restructuring that extends repayment timelines without necessarily reducing face value.

The dataset is provided in four formats: Excel workbook (with both long and tabular layouts), CSV long format (optimized for machine reading), and CSV tabular format (optimized for human reading), and as a CSV data network (for social network analysis of value, creditors, debtors, and observers)

1.1. Relationship to Existing Datasets

To date, the official website of the Paris Club provides only high-level aggregate statistics, and analysis of granular agreement-level data remains inaccessible to those lacking data engineering skills. The dataset introduced here expands significantly on previous efforts to provide insight into the Club's activities. Compared to the commonly used 2016 dataset by Cheng et al., which covered 422 agreements across 86 debtor countries through 2015, this dataset adds a decade of restructurings (to 543 agreements by 102 countries through 14 April 2026) and significantly expands metadata captured at the agreement level. Cheng et al. included debt category, amounts treated, nominal relief, terms, and participating creditors; this dataset offers new categories including cut-off dates, observers, meeting chairs, debtor delegation heads, specific provisions, and links to associated documentation, and attaches agreement value to recent Debt Service Suspension Initiative (DSSI) agreements (which remains absent on individual DSSI agreement pages published by the Club).

Given limitations in the official data, researchers of the Paris Club activities have previously turned to secondary dataset compilations in order to capture the Club's activities in the wake of the COVID-19 pandemic. To give one example, a recent Working Paper by the Banque de France leveraged the Cheng et al. dataset—which the researchers emphasize "remains the most comprehensive publicly available information on Paris Club debt treatments"—to analyze the effects of debt restructuring by the Paris Club on firm sales growth (Ferry, Jacolin, and Dufresnel 2025, 37). To do so, the researchers drew on a secondary dataset that updated the 2016 dataset by Cheng et al. to 2021 to account for the financial fallout of the COVID-19 pandemic (Horn, Reinhart, and Trebesch 2022). The updated dataset by Horn et al. however is not openly accessible, nor is it within the reach of most researchers to combine different datasets in order to achieve an up-to-date overview of the Paris Club's activities.

Our dataset, originally compiled in the process of qualitative research into the history of the Paris Club, addresses this significant gap in publicly accessible international finance data. Notably, it enables analysis of long-term trends in debtor and creditor participation in Club agreements, evolution of debt treatment across debt crises, and comparative research on sovereign debt restructuring. The dataset was constructed through web scraping and reverse-engineering of the Paris Club website (clubdeparis.org) in February 2025, with subsequent manual additions through April 2026. Significant website restructuring between February and October 2025 required methodological adaptations detailed in Section 2. All monetary values have been converted from text strings to numeric format with extensive validation.

1.2. File Manifest

The Paris Club Dataset consists of the following files:

- *ParisClub_Data.xlsx*

  Master file containing four worksheets: (1) "metadata" describing the worksheets and field metadata; (2) "Tabular Format" with one row per agreement and all variables in columns; (3) "Long Format" with agreement-grouped layout; and (4) "Network" which is structured for social network analysis.

- *ParisClub_Data_Long.csv*

  Machine-readable format with one row per agreement. All 484 agreements all variables. Comma-delimited text file.

- *ParisClub_Data_Tabular.csv*

  Human-readable format with agreement details organized for intuitive browsing. Comma-delimited text file.

- *ParisClub_Data_Network.csv*

  Machine-readable format structured for social network analysis of value, creditors, debtors, and observers. Comma-delimited text file. An example of how to visualise this data is given here: https://public.flourish.studio/visualisation/23954298/

- *Methodology.pdf*

  Complete technical documentation describing data collection methods, web scraping procedures, data processing steps, validation protocols, and code listings. Includes all technical appendices.

- *README.md*

  Quick-start guide with dataset overview, variable list, citation information, and contact details. Markdown text file readable in any text editor.

2. Data Collection Methodology

Access to basic quantitative information on Paris Club activity remains limited. What data is provided by the Paris Club's website today is restricted to: a) high-level data points like the total number of agreements and the value of the debt treated (484 agreements valued at US$616 billion across 102 debtor countries) in the "key numbers" part of the website[1] (Paris Club 2025a); and b) summaries of certain years published in PDFs in the "Paris Club claims" part of the website. Importantly, the Paris Club's key numbers do not suffice to answer even simple questions about the Club's operations, such as which countries return to the Club most often, or other trends in creditor or debtor participation. Granular data on individual agreements, while it exists, is hard to access and aggregated analysis remains inaccessible to those who lack the necessary data engineering skills to retrieve this content.

Methodologically, to overcome the time-consuming steps needed to obtain simple data from the Paris Club website, the data on the 'http://clubdeparis.org/en/traitements' domain (Paris Club 2024b) was reverse-engineered. The "traitements" website was scraped manually in February 2025 to find all relevant URLs to the 484 agreements then listed on the website, which excludes the DSSI extensions (see Section 2.1 and Figure 1 for an example of such an agreement). Time-consuming data engineering was necessary to extract individual data and metadata records from the Paris Club website and compile them into an accessible format to facilitate analysis—a process prohibitive to most. Moreover, as of February 2025, the only way to reach this part of the website was to find it in a search engine that, by chance, had this part of the website indexed. Between February and October of 2025, the website has undergone changes which have completely removed the "traitements" section of the website. Currently, the only place to find an overview of all treatments is through the website sitemap.

2.1. Finding the 'Traitements' Part of the Paris Club Website

A 'sitemap' is a standardized part of information structuring and website design that helps humans and computer algorithms, like search engines, understand how a website is structured and where certain information can be found (Sitemaps.org 2020). In its standardised form it should a) provide an overview of the whole website, and b) be up-to-date. The Paris Club sitemap is neither, as demonstrated in the following two examples. In figure 1 no direct reference or link to the part of the site that contains the described data https://clubdeparis.org/en/traitements (Paris Club Website 2024b) can be found, and the webpage describing 2024 exists on the website but is not part of the overview- which shows that it is incomplete. Furthermore, the links to the 2023 and 2021 data are broken which show that the sitemap is out of date.

[1] The numbers published by the Paris Club differ substantially from the numbers we present here. This is due to our counting of each DSSI extension as a separate agreement, and including into the total amount the value of the DSSI treatments (where the Paris Club currently does not). Without these decisions, the high-level data points listed on the website are close to but do not entirely match the data that was cross-referenced from their own website and captured by this dataset; before adding the value of the DSSI agreements and counting the first and final DSSI extensions as separate agreements, we count 484 agreements valued at US$610 billion across 102 debtor countries. For more information on our classification of the DSSI agreements, see also Section 2.4.

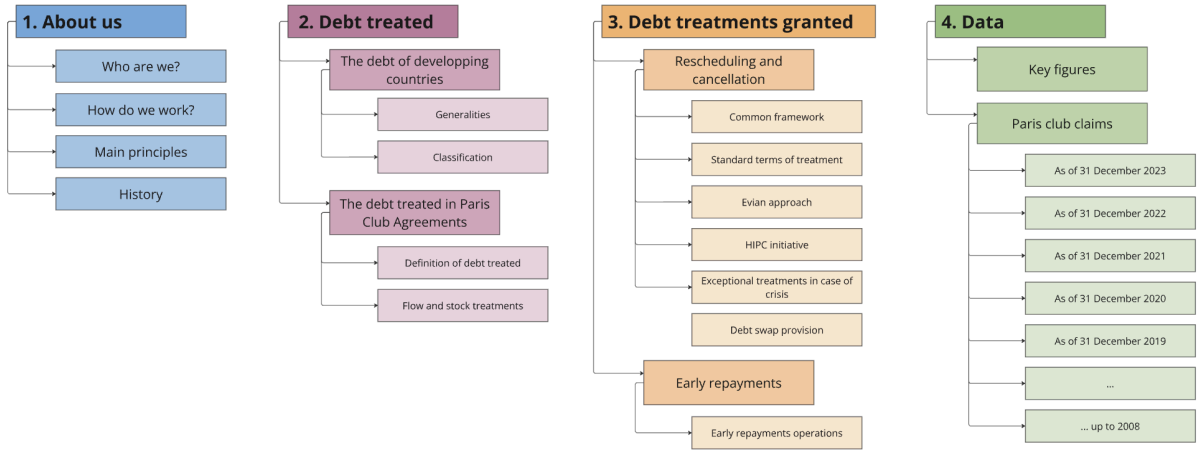

Figure 1. Visualisation of the site-map of the Paris Club website. Note that the part of the website which contains the data of all the agreements is left out (Paris Club 2025d).

Once found, this new "Traitements" area of the website provided a whole host of new data available for analysis. The structure of this table and the options for filtering suggests that underlying this frontend website there is a dataset that has an API or Application Programming Interface that is used by the website internally. It is general practice for online services to provide access for third parties to access their services through API as well as human readable tables. If supported and documented properly, an API is one of the most transparent and accessible ways to share data; most online services publish public versions of their API for those interested in building applications or exploring data. It essentially provides an overview and instructions on how to access certain data points. However, no API documentation or supporting information was found on the clubdeparis.org domain.

The February to October 2025 changes to the clubdeparis.org website completely changed how to access the data hosted on their website (see also Section 2.3). They have implemented a sitemap that links to each of their agreements, but the filtering method that was present earlier has been removed, and the agreements are in a random order. This makes it difficult to access the files in a structured manner.

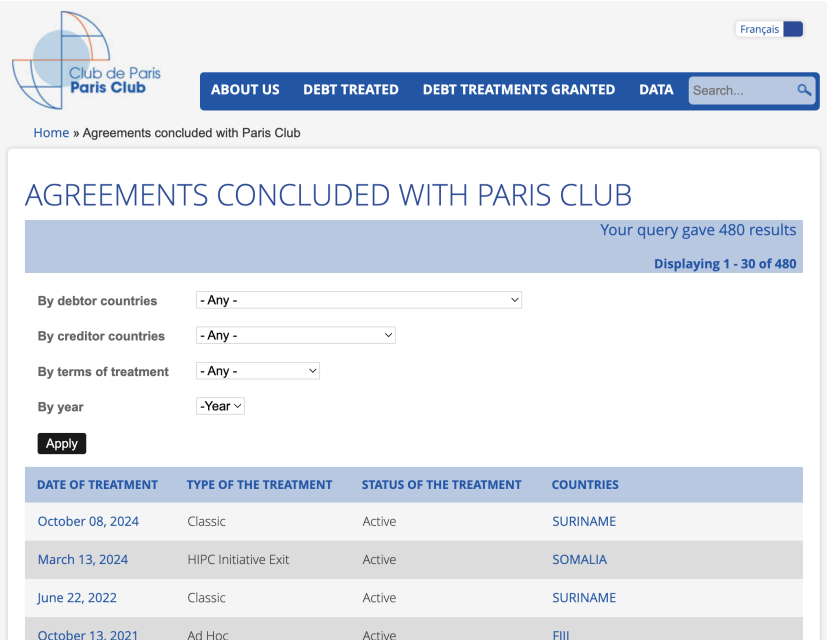

Figure 2. Screenshot of the https://clubdeparis.org/en/traitements part of the website which allows for searching and filtering. Note that since the October 2025 website changes, this filtering interface is not available anymore.

At time of extraction, the data allowed for filtering and finding details of each individual agreement, but the numbers and details of such agreements remain buried in further links and attached .pdf files. There is no way of accessing aggregate information. The website update of February–October 2025 has added a section to the site-map that lists agreements by countries and years. However, the website's country-level agreement listings contain several omissions that are not immediately apparent from the country search portal. In at least three cases—Yemen, the Russian Federation, and Egypt—the portal returns fewer agreements than the dataset records. Yemen's country overview lists three agreements, yet a fourth, dated 24 September 1996 (US$112 million treated), exists at its own URL and can only be retrieved by navigating directly to the agreement page. The Russian Federation's portal returns four results, omitting a 1996 agreement worth US$40,160 million; because this amount is large enough that its absence would substantially widen the gap between the Paris Club's own headline totals and our initial, pre-DSSI dataset figures, it appears the website does include it in its aggregate tallies even though the country tag fails to surface it. Egypt's portal similarly returns only one result, with the 22 May 1987 agreement absent from the listing but accessible via direct URL.

A related issue affects URL construction: several agreement pages generated during scraping suffered from truncated or misspelled URLs (e.g., sao-tome-et-principe-12-aout-202.html instead of sao-tome-et-principe-12-aout-2020.html). Taken together, these discrepancies suggest that the website's country-tagging is unreliable as an exhaustive index of agreements—agreements may exist and be counted in the site's aggregate totals while remaining invisible through the standard country search. Researchers relying solely on the portal-level listings risk undercounting a country's restructuring history.

Albeit imperfectly, the website in its current form allows for filtering by year and debtor—nevetheless, there are no accessible means of categorisation and aggregation. This

makes it difficult to answer simple questions like how much debt is held in the African continent. This calls to mind the notion of data obfuscation, a term used in cryptography which describes "hiding a needle in a haystack" by making it arbitrarily hard to access sensitive data (Goldwasser and Rothblum 2007). Obfuscation can be achieved by either a) placing irrelevant information alongside valuable information and in that way shifting the burden of discerning what is valuable onto the reader of that information, or b) increasing the difficulty of obtaining the valuable data through for instance adding arbitrary steps which make it time consuming. Whether intended or not, the data on Paris Club Agreements are not accessible to the public eye and it would be easy to accuse them of obfuscation.

2.2. Web Scraping Methodology

The data on the 'http://clubdeparis.org/en/traitements' domain (Paris Club 2024b) was reverse-engineered with the help of the Python version 3.11 (Python Software Foundation. 2022) programming language in combination with the python-requests (Reitz 2025) package for interacting with HTTP hyperlinks and BeautifulSoup package (Richardson 2025) for extracting data from HTML and XML data formats.

The "traitements" website was scraped manually in February 2025 to find all relevant URLs to the 543 agreements stated on the website, and to disaggregate and assign agreement values to the DSSI agreements and their first and final extensions—which the Paris Club website does not do. 4 missing agreements published since have been added manually to complete the dataset, including all agreements published on the website through April 2026. The methodology laid out below reflects the site structure as it existed in February 2025. An example URL for the agreement with Somalia conducted on 13 March 2024 is 'https://clubdeparis.org/en/traitements/somalia-13-03-2024/en', which used to lead the reader to a html website describing various details of the agreement, with links to several relevant documents. Note that in this example the new associated url (following the website update between February and October 2025) now maps to 'https://clubdeparis.org/en/sites/clubdeparis/accueil/accords-signes-avec-le-club-de-p/recherche-accords-signes/fiches/somalie-13-mars-2024.html'.

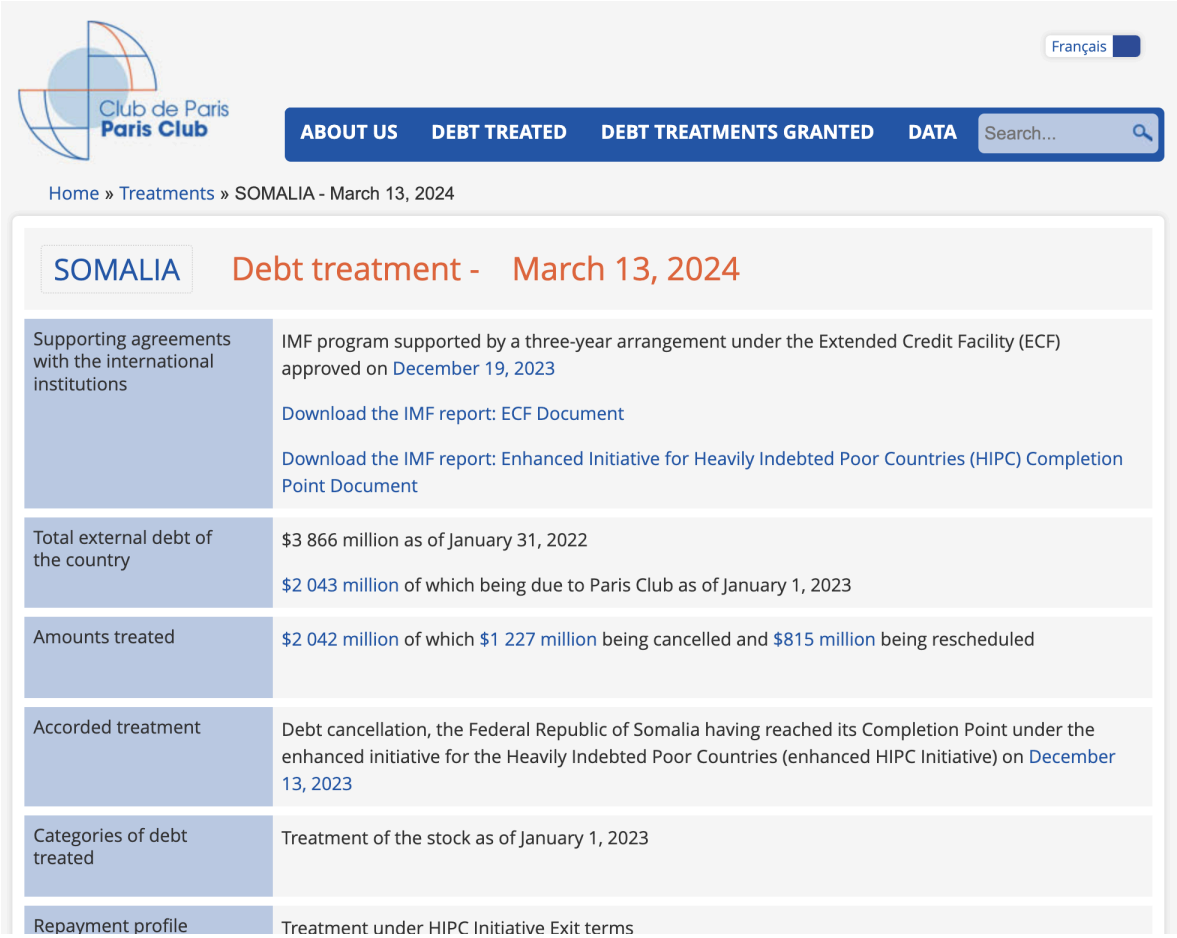

Figure 3. Screenshot of the webpage with details of the March 13 agreement with Somalia.

A wrapper function was written that first a) extracts HTML data from the known URLs using the requests library (see also Appendix A - http requests), after which b) the BeautifulSoup library was used to read, extract, and output data in a structured manner using the HTML header signifiers (see also Appendix B - BeautifulSoup Queries). The result of running this function for a single agreement is shown in Appendix C (Example result from function). Table 1 shows a small subset of the data.

Table 1. A small subset of the structured data of Appendix C, for a single Paris Club agreement concluded between the Paris Club and Somalia in 2024.

Key	Value
url	https://clubdeparis.org/en/traitements/somalia-13-03-2024/en
Debtor	SOMALIA
Accorded treatment	Debt cancellation, the Federal Republic of Somalia having reached its Completion Point under the enhanced initiative for the Heavily Indebted Poor Countries (enhanced HIPC Initiative) on December 13, 2023
Amounts treated	$2 042 million of which $1227 million being cancelled and $815 million being

	rescheduled
Categories of debt treated	Treatment of the stock as of January 1, 2023
Cut-off date	1 October 1984
Participating creditors	BELGIUM; DENMARK; FRANCE; ITALY; JAPAN; NETHERLANDS; NORWAY; RUSSIAN FEDERATION; SPAIN; UNITED KINGDOM; UNITED STATES OF AMERICA
Repayment profile	Treatment under HIPC Initiative Exit terms; In addition, Paris Club creditors confirmed their willingness to grant additional debt cancellation on a voluntary and bilateral basis for an amount of USD 815 million
Observers1	African Development Bank; World Bank; European Commission; IMF; OECD
Observers2	AUSTRALIA, AUSTRIA, BRAZIL, CANADA, FINLAND, IRELAND, ISRAEL, SAUDI ARABIA, SWEDEN, SWITZERLAND
Total external debt of the country	$3 866 million as of January 31, 2022; $2 043 million of which being due to Paris Club as of January 1, 2023
Attached file: https	https://clubdeparis.org/en/file/4199/download?token=pOlvsOn9

Note again that the urls in this example were broken following changes to the website between February and October 2025 (see also Section 2.3).

Table 2. Examples of attachments for an agreement.

attachment treated	***attachment cancelled***	***attachment rescheduled***
https://clubdeparis.org/files/live/sites/clubdeparis/files/contributed/01%20Fiches%20de%20traitement-PJ/4-ACCORDS%20CONCLUS-S%c3%a9n%c3%a9gal%20%c3%a0%20Zambie/Somalie-31%20mars%202020/Somalia-31%2003%202020-Amounts%20treated.pdf	*https://clubdeparis.org/files/live/sites/clubdeparis/files/contributed/01%20Fiches%20de%20traitement-PJ/4-ACCORDS%20CONCLUS-S%c3%a9n%c3%a9gal%20%c3%a0%20Zambie/Somalie-31%20mars%202020/Somalia-31%2003%202020-Amounts%20cancelled.pdf*	*https://clubdeparis.org/files/live/sites/clubdeparis/files/contributed/01%20Fiches%20de%20traitement-PJ/4-ACCORDS%20CONCLUS-S%c3%a9n%c3%a9gal%20%c3%a0%20Zambie/Somalie-31%20mars%202020/Somalia-31%2003%202020-Amounts%20rescheduled.pdf*

Additional post-processing steps were necessary for the data in Table 1 to be fully structured. Processing steps included the conversion of text strings to numerical values, and the validation of their data types. To give one generic example: processing involved the

conversion of text strings such as “$2 042 million of which $1227 million being cancelled and $815 million being rescheduled” into json data structured as:

```
{“Amount treated” : 2042000000,
 “Amount cancelled” : 1227000000,
 “Amount rescheduled” : 815000000}
```

2.3. Accounting for Website Updates + Manual Additions

The functions described above were run on each of the urls for the 484 agreements published on the Paris Club website in January 2025. A core methodological challenge was to retrieve data for all 484 agreements and present it in a structured way that allows for aggregating and grouping the data as desired. A significant drawback of this method is that it is difficult to fully automate the “restructuring” of the data provided by the Paris Club. Regular website maintenance introduces many changes, and any small change appearing on the Paris Club website would necessitate updating the data engineering methodology. In fact, precisely this happened in the process of constructing this dataset: having completed the initial data collection, the authors found that the Paris Club website had been changed between February and October 2025.

The significant changes made to the clubdeparis.org website between February and October 2025 rendered the previous method obsolete. The existing links to the website were broken, and links to the data were moved from the ‘traitements’ part of the websites to the sitemap. Attempts were made to rewrite the code to accommodate the changes on the website, but many inconsistencies were found in how the new website handles urls and arbitrarily and incorrectly names countries. This rendered it impossible to write a script that could extract a complete set of data on Paris Club Agreements from their website. The new method is published in this methodological note (and is marked ‘post oct’2025 workflow’) which is able to extract meaningful amounts of data. Because the links are now hosted in French with inconsistently named countries and spellings, it costs exceedingly more effort to extract the data, and the researchers did not manage to replicate a method that could take a consistent snapshot of the data currently hosted.

Crucially, the website update included the release of several previously unpublished agreements from 2022-2024 which, including our disaggregation of DSSI agreements, has brought the total number of agreements to 543. As an additional consequence of the website change, all the URLs linking to external attachments in the data we found were also lost. These changes required manual intervention. Proceeding from the dataset scraped in February 2025, and with the help of additional time-consuming manual scraping efforts, the lost agreement and URLs were mapped to their new locations. Around 85% of the lost urls were mapped to their new locations by scraping—others were updated by hand. Where manual edits were made, the dataset excel file contains cell notes for reference. The links to the external agreement attachments were lost and could not be recovered. The 59 previously unpublished Paris Club agreements reflecting the DSSI agreements from 2020-2021 (including disaggregation reflecting the first and final extensions) were added manually following the initial scrape.

2.4. Categorizing the post-2020 DSSI agreements

One will note the difference between the aggregate numbers listed here and the high-level data points published by the Paris Club in the "key numbers" part of the website (Paris Club 2025a). As of 21 January 2026, the Paris Club lists 484 agreements valued at US$616 billion across 102 debtor countries. However, these totals do not reflect the amount of the debt restructured following the COVID-19 pandemic under the Debt Service Suspension Initiative (DSSI). Nor do they account for the repeat visits to the Paris Club by debtor delegations to secure a first or a final extension of the DSSI (Paris Club 2025b). Including these, we find 543 agreements, totalling US$863 billion.[2]

The post-2020 DSSI agreements under the DSSI commonly involve an (1) initial agreement, and at times (2) an extension of the agreement, or even (3) a final extension of the agreement. These three distinct moments have been grouped together under a single URL by the Paris Club—even when they reflect different amounts, and differently dated visits to the Paris Club (including, at times, different meeting chairs and debtor delegation heads). The total amount of debt treated under the DSSI is currently not reflected in the aggregate numbers published on the Paris Club website (Paris Club 2025a). It is also absent from the individual agreement pages, showing up as an empty field in the original scraping exercise. Nevertheless, an overview of the amounts of the DSSI agreements was available on the site, albeit on a separate page (Paris Club 2025b). Our inclusion of the DSSI amounts helps create a more accurate picture of the total debt restructured by the Paris Club.

We have manually added not only the initial DSSI agreement, but also, where they exist, the debtor country's first and final DSSI extension into the dataset. This circumvents the Paris Club's current listing of the original agreement and possible extensions under a single URL (which suggests that these reflect only a single restructuring moment). Our reasoning for taking this step is that it differs per country whether or not it has concluded not just an initial agreement but also one or two extensions. Furthermore, in the documentation that exists, each of these "extensions" does have its own date and required a separate trip to Paris by the debtor country's delegation (details of which are listed separately on the page that lays out the country's DSSI agreement). The overview of the DSSI agreements shows the amounts of debt treated disambiguated according to the initial agreement and its extensions (Paris Club 2025b). Separating a country's different DSSI agreements allows us to more accurately reflect the number of Paris Club meetings and a country's separate restructuring moments.

3. Data Post-processing

For a computer, "$2 042 million" has the data format of a 'text string' and not a numerical value. To interpret this as a numerical value, regex was used to interpret the digits as values by trying to decipher the various inconsistencies apparent in the data (Python Software Foundation 2025). This is the area where the most errors might emerge. For example, consider the string from the Suriname 08-10-2024 agreement:

US$ 2,694 million of which US$ 88 million due to the Paris Club as of 31 December 2023 (source: IMF)

[2] It should be noted that when not accounting for the DSSI amounts, or counting the first or final DSSI extensions, we arrive at numbers close to, but not fully the same as those listed on the website; we count 484 agreements valued at US$610 billion across 102 debtor countries.

Where generally the dataset prefers to describe numbers with a whitespace as a thousands separator (2 694 million), here the text uses a comma "," as a thousands separator—and the method would read this separator as a decimal indicator. Several such inconsistencies have been identified and whilst most have been addressed in the dataset, it is possible that an error has been overseen. When using the dataset, make sure to always double-check numbers with the originally published supplied HTML website and .pdf files to verify the data.

4. Dataset Structure and Variables

4.1. File Formats and Data Organization

The Paris Club Dataset is provided in the following four formats, with all three files containing identical data:

- Excel Format (*ParisClub_Data.xlsx*):
  The complete dataset, which includes both long and tabular layouts for flexible analysis, and notes on individual fields where manual editing was required.

- CSV Long Format (*ParisClub_Data_Long.csv*):
  Optimized for machine reading. Note that individual cell notes (of manual edits) are not inherited from the excel file.

- CSV Tabular Format (*ParisClub_Data_Tabular.csv*):
  Optimized for human reading and browsing. Note that individual cell notes (of manual edits) are not inherited from the excel file

- CSV Tabular Format (*ParisClub_Data_Network.csv*):
  Optimized for network analysis of creditors, debtors, and observers. Note that individual cell notes (of manual edits) are not inherited from the excel file.

4.2. Variable Definitions and Codebook (Metadata)

The dataset contains the following variables extracted from the Paris Club's agreement webpages. Table 3 provides a complete codebook with 'Data Field', 'Source' and 'Authors'

Table 3. Codebook or metadata for all variables used in the data. The Paris Club Dataset contains 43 data fields, 18 of which were directly copied from the Paris Club website. Note that the Paris Club website does not provide metadata of any of the data fields on their website. A description of the data field is provided with the explicit note that this is a subjective interpretation by the researching authors.

Data Field	Source	Authors' interpretation of data field
Debtor	Scraped from the Paris Club data	The name of the involved debtor country.
Accorded treatment	Scraped from the Paris Club data	Description of debt treatment
Amounts treated	Scraped from the Paris Club data	Disambiguation of debt treated in USD
Categories of debt treated	Scraped from the Paris Club data	Types of debt included in treatment
Comparability of treatment	Scraped from the Paris Club data	Comparability of treatment clause text

provision		
Cut-off date	Scraped from the Paris Club data	Cut-off date for eligible debt
Participating creditors	Scraped from the Paris Club data	List of creditor countries involved
Repayment profile	Scraped from the Paris Club data	Repayment terms (treatment) and schedule
Observers1	Scraped from the Paris Club data	List of observing organisations
Observers2	Scraped from the Paris Club data	List of observing countries involved
Specific provisions	Scraped from the Paris Club data	Additional specific provisions in agreement
Total external debt of the country	Scraped from the Paris Club data	Total external debt of debtor country
Supporting agreements with the international institutions	Scraped from the Paris Club data	Details of supporting IMF agreements
Attached file	Scraped from the Paris Club data	URLs to official agreement documents (PDFs)
Organisation of the session	Scraped from the Paris Club data	Details of agreement signatories; notably Paris Club (co-)chair and debtor country delegation head
Date of treatment	Scraped from the Paris Club data	The date that the agreement was signed
Year	Scraped from the Paris Club data	The year in which the agreement was signed
Type of treatment	Scraped from the Paris Club data	Type of debt treatment
url	Inferred from data field	url from the pre-2025 website structure
url_2026	Inferred from data field	(current, as of 2026-04) url linking to agreement. For more recent agreements, broken urls were fixed using manual scraping, individual fields that were manually edited are supplied with a note.
Treatment Amount [MUSD]	Inferred from data field	Numerical values extracted from 'Amounts treated'
Treatment Canceled [MUSD]	Inferred from data field	Numerical values extracted from 'Amounts treated'
Treatment Rescheduled [MUSD]	Inferred from data field	Numerical values extracted from 'Amounts treated'
Total External Debt [MUSD]	Inferred from data field	Numerical values extracted from 'Total external debt of the country'
External Debt due to Paris Club [MUSD]	Inferred from data field	Numerical values extracted from 'Total external debt of the country'
attachment treated	Inferred from data field	File name and url of attachment, extracted from: 'Attached file'
attachment cancelled	Inferred from data field	File name and url of attachment, extracted from: 'Attached file'
attachment rescheduled	Inferred from data field	File name and url of attachment, extracted from: 'Attached file'

4.3. Data Types and Formats

Numeric Variables:

All monetary amounts are stored as integers representing millions of USD values with two decimal places: e.g. amount treated = M$ 1490.00.

Text Variables:

Text fields preserve original wording from Paris Club webpages, including:

- Capitalization (e.g., debtor countries in ALL CAPS: “SOMALIA”)
- Punctuation and formatting
- Full clause text for legal provisions

Date Variables:

Dates are formatted as DD/MM/YYYY (e.g., 13/03/2024) to match Paris Club convention. For time-series analysis, users may need to convert to the date format of their statistical software.

List Variables:

Several variables contain lists of entities (creditors, observers) separated by commas. To analyze individual entities:

- Split on comma delimiter
- Trim whitespace
- Standardize country name variations if needed (e.g., “UNITED STATES OF AMERICA” vs “USA”)

5. Known Limitations and Challenges

Note that as of writing, no API (Application Programming Interface) is published on the website, which effectively details how their data can be accessed. Ideally, the Paris Club secretariat would work with stakeholders to release their data in an accessible format. An API facilitates open data sharing and management, and is common practice for institutions like the World Bank, which for example has “The World Bank Documents & Report API” (World Bank 2025). The simple practice of publishing an API would make Paris Club data easily accessible and make redundant the time consuming data engineering exercises described here, obviating the need for third-party researchers to construct a dataset of Paris Club activity that needs updating every decade or so (Cheng, Díaz-Cassou, and Erce 2016).

In the view of the authors, it should not be the responsibility of third-party researchers to maintain a transparent database of the activities of a financial actor as significant as the Paris Club. Ideally, this responsibility should lie with the Paris Club’s creditors or perhaps the French Treasury, which takes pride in providing the Paris Club’s secretariat. Thankfully, many resources exist that can support an organisation or branch of government in adopting open standards for data sharing and management.

5.1. Website Updates: Capturing a Moving Target

The dataset construction relies on web scraping methods that are vulnerable to structural changes on the Paris Club website. As mentioned, regular website maintenance introduces many changes, and any small change made on the Paris Club website would require updating this methodology to include future agreements. Some examples include: changes in wording of a restructuring, the occurrence of a typing mistake (e.g. “Amounts treated” into “Amount treated”), a change in the method by which their .pdf files are generated, or the basic formatting of the Paris Club website itself.

Between February and October 2025, significant changes to the Paris Club website required methodological adaptations (see also Section 2.4). Previously unpublished agreements from 2022-2024 were introduced, while scraped URLs linking to external attachments in the data were broken.

An attempt was made to fundamentally update the methodology and scrape data anew from the updated website, which involved navigating the French version of the website, and navigating to xpath locations found in the sitemap, to then reconstruct the urls from a newly visible common pattern.

This new methodology is also hosted on github on the main branch- the original methodology can be found on the branch 'deprecated workflow'.

However, the new website structure makes ripping the data prohibitively difficult and not as reliable. We ultimately chose to instead manually update the old dataset from February 2025, and have added the newly released agreements by hand. Because the method did not manage to fully deliver a complete snapshot, it is not further documented. The newly published agreements and broken urls were added by hand (see also Section 2.3).

All this illustrates the methodological trickiness of constructing a dataset upon a shifting site structure, especially when paired with irregular releases of new data points, and persistent inconsistencies and irregularities in the data itself. Users should be aware that given the absence of an official API, future updates may require manual intervention.

5.2. Missing Values and Data Availability

The Paris Club has not published information consistently across all agreements or time periods. Missing values may occur for several reasons. Some systemic reasons for missing data include:

1. Limited metadata available for early agreements (1956–1990s):

- Total external debt, supporting agreement with the IMF, and meeting chair and debtor delegation head are rarely documented for this period ("Total external debt of the country", "Supporting agreements with the international institutions", "Organisation of the session")
- Observing institutions and observing countries are likewise more regularly absent ("Observers 1" and "Observers 2")

2. Website inconsistencies, with some fields only added to website template in later years:

- Meeting chair and debtor delegation head ("Organisation of the Session")
- Older agreements tend to miss attached files ("Attached file")

5.3. Data Quality Notes and Validation

String-to-Numeric Conversion Issues:

The most significant data quality challenge involves converting text descriptions of debt amounts to numeric values. The Paris Club uses inconsistent formatting:

- Thousands separators: mix of spaces ("2 042 million"), commas ("2,694 million"), and no separator
- Decimal indicators: inconsistent use of periods vs commas
- Currency units: mix of USD, million, billion, without standardization
- Compound statements: single field containing multiple amounts (treated, cancelled, rescheduled)

Example from Somalia 2024 agreement:

- Raw text: “2 042 million of which 1227 million being cancelled and 815 million being rescheduled”
- Processed: amounts_treated_usd = 2042000000, amounts_cancelled_usd = 1227000000, amounts_rescheduled_usd = 815000000

Regular expressions (regex) were used to parse these variations, but errors may remain. Users should cross-reference critical monetary figures with original Paris Club documentation via the attached_files_urls links.

Known Data Quality Issues:

1. URL integrity (following February-October 2025 website changes):

- Approximately 85% of attachment URLs were successfully remapped to new locations using automated means
- Remaining 15% required manual updates but all urls were mapped and validated. The excel file contains cell notes for reference
- All url fields reflect current (April 2026) website structure

2. Country name variations:

- Paris Club uses inconsistent spellings across time periods, e.g., “IVORY COAST” vs “CÔTE D’IVOIRE”
- Dataset preserves original spelling from each agreement

3. Creditor name changes:

- Historical creditors listed as they appeared at time of agreement
- E.g., “USSR” in older agreements, “RUSSIAN FEDERATION” in newer ones
- No retroactive standardization applied

4. Currency denomination:

- USD conversion reflects Paris Club’s published values
- Exchange rates and conversion methods are not documented by the Paris Club

Validation:

The Paris Club Dataset is “complete” in the sense that it has been validated against the Paris Club official website to the best of our abilities. Missing or empty fields in the dataset should reflect empty or missing data on the website.

However, please note occasional inconsistencies in original Paris Club figures and URL structures, and the remaining risk in text-to-numeric conversion of monetary amounts. Our advice is to cross-check critical numbers against the original agreements and PDFs via the included URLs.

TECHNICAL APPENDICES

APPENDIX A - http requests

The difficulty of reliably machine reading from HTML and .pdf files is that data is embedded in a visual formatting language designed to tell a printer how to distribute ink; this format is notoriously difficult and unreliable to read, even for the latest Large Language Models like ChatGPT (Xie et al 2024). The only way to discover how data is encoded is by trial and error using the BeautifulSoup python package, and any upstream changes on the Paris Club website would likely render this method obsolete. For example, the relevant data point for Debtor (i.e. SOMALIA) was found embedded in the styling element identifiable as `"field field-name-field-treatment-de-c field-type-taxonomy-term-reference field-label-hidden clearfix"` and the list of participating creditors (i.e. Belgium, Denmark, …, etc) was found encoded in the styling element: "`group-traitment-body-s10-3 field-group-html-element`". The full table describing the data points and how they are embedded in .pdf by the current Paris Club can be found in Appendix B - BeautifulSoup Queries.

APPENDIX C - Example result from function

C.1 - Function call result for pre oct'2025 workflow

```
      url =
"https://clubdeparis.org/en/traitements/somalia-13-03-2024/en"
      read(url, queries)
```

Table 3. Function call result for pre oct'2025 workflow.

Key	Value
url	https://clubdeparis.org/en/traitements/somalia-13-03-2024/en
Debtor	SOMALIA
Accorded treatment	Debt cancellation, the Federal Republic of Somalia having reached its Completion Point under the enhanced initiative for the Heavily Indebted Poor Countries (enhanced HIPC Initiative) on December 13, 2023
Amounts treated	$2 042 million of which $1227 million being cancelled and $815 million being rescheduled
Categories of debt treated	Treatment of the stock as of January 1, 2023
Comparability of treatment provision	The Federal Republic of Somalia was declared eligible to the Enhanced HIPC Initiative by the IDA and the IMF in February 2020 and was declared to have reached its Completion Point in December 2023. In this context, the Federal Republic of Somalia commits to seek promptly from all its external creditors which are not participating in the Agreed Minutes dated March 13, 2024, their appropriate contribution in terms of debt relief to the Enhanced HIPC Initiative, on top of traditional debt relief mechanisms and consistent with the proportional burden sharing based on their relative exposure in net present value of total external debt at Decision Point after the full use of traditional debt relief mechanisms. Whether the debt relief provided is appropriate will be assessed not only on the basis of the reduction in the net present value of the debt as computed under Appropriate Market Rate, but also on the terms of repayment of the debts not cancelled. For this purpose, all relevant elements will be taken into account, including the level of cash payments received by those creditors as compared to their share in the Federal Republic of Somalia's external debt; the nature and characteristics of all treatment applied, including debt buy backs; all characteristics of the reorganized claims and in particular their repayment terms regardless of the forms they take; and, more generally, the financial relations between the Federal Republic of Somalia and all its other creditors. Consequently, the Federal Republic of Somalia commits not to accord any category of external creditors -and in particular litigating creditors, creditor countries not participating in the Agreed Minutes dated March 13, 2024, commercial banks, suppliers and bondholders- a treatment more favourable than that accorded to the Participating Creditor Countries
Cut-off date	1 October 1984
Participating creditors	BELGIUM; DENMARK; FRANCE; ITALY; JAPAN; NETHERLANDS; NORWAY; RUSSIAN FEDERATION; SPAIN; UNITED KINGDOM; UNITED STATES OF AMERICA

Repayment profile	Treatment under HIPC Initiative Exit terms; In addition, Paris Club creditors confirmed their willingness to grant additional debt cancellation on a voluntary and bilateral basis for an amount of USD 815 million
Observers1	African Development Bank; World Bank; European Commission; IMF; OECD
Observers2	AUSTRALIA, AUSTRIA, BRAZIL, CANADA, FINLAND, IRELAND, ISRAEL, SAUDI ARABIA, SWEDEN, SWITZERLAND
Total external debt of the country	$3 866 million as of January 31, 2022; $2 043 million of which being due to Paris Club as of January 1, 2023
Supporting agreements with the international institutions: IMF program supported by a three-year arrangement under the Extended Credit Facility (ECF) approved on December 19, 2023; Download the IMF report: ECF Document; Download the IMF report	IMF program supported by a three-year arrangement under the Extended Credit Facility (ECF) approved on December 19, 2023; Download the IMF report: ECF Document; Download the IMF report: Enhanced Initiative for Heavily Indebted Poor Countries (HIPC) Completion Point Document
